

Functional Snapshot for Security-Questions Project (Stage-2-hackathon : React SPA using REST API)

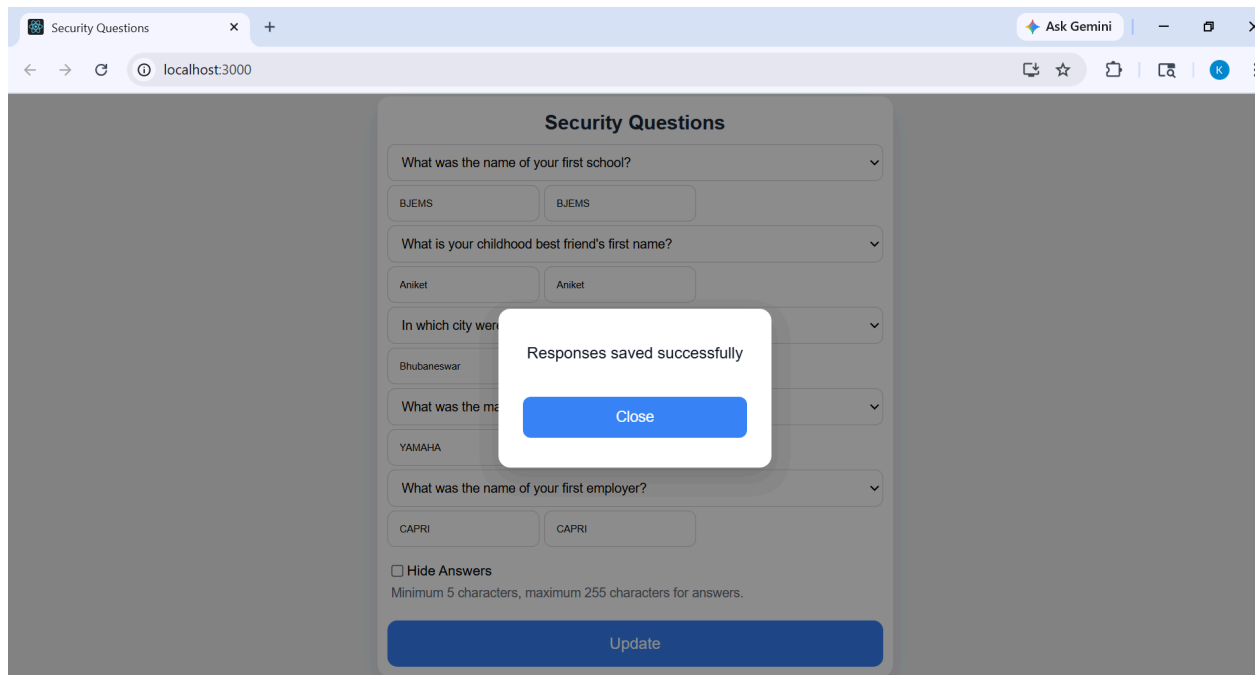

The screenshot shows a web browser window with the title "Security Questions" and the URL "localhost:3000". The page displays a form titled "Security Questions" with five questions, each with a dropdown menu and two input fields for answers. The questions are:

- What was the name of your first school?
- What is your childhood best friend's first name?
- In which city were you born?
- What was the make of your first vehicle?
- What was the name of your first employer?

Below the questions, there is a checkbox labeled "Hide Answers" which is checked. A note below the checkbox states: "Minimum 5 characters, maximum 255 characters for answers." At the bottom of the form is a blue button labeled "Update".

Snapshot 1: Main page with Hide Answer Feature

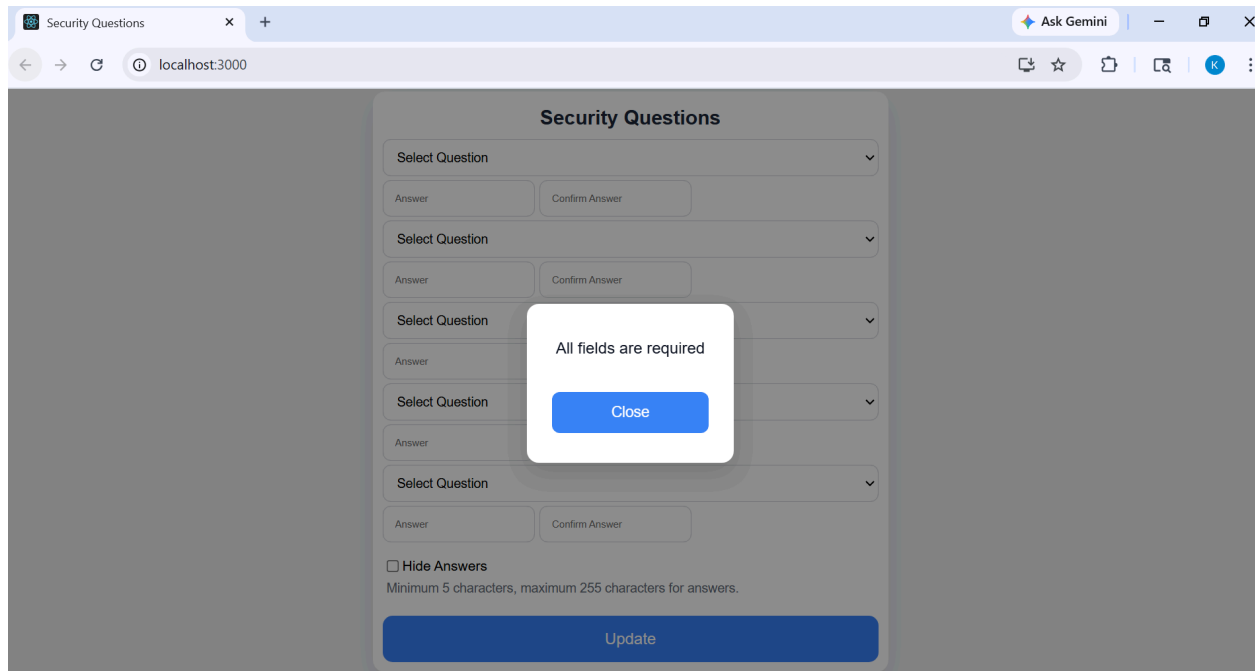

The screenshot shows the same "Security Questions" form as in Snapshot 1, but with a success message overlay. The message is "Responses saved successfully" and is displayed in a white box with a blue "Close" button. The form fields are now populated with the following values:

- What was the name of your first school? (Dropdown: BJEMS)
- What is your childhood best friend's first name? (Dropdown: Aniket)
- In which city were you born? (Dropdown: Bhubaneswar)
- What was the make of your first vehicle? (Dropdown: YAMAHA)
- What was the name of your first employer? (Dropdown: CAPRI)

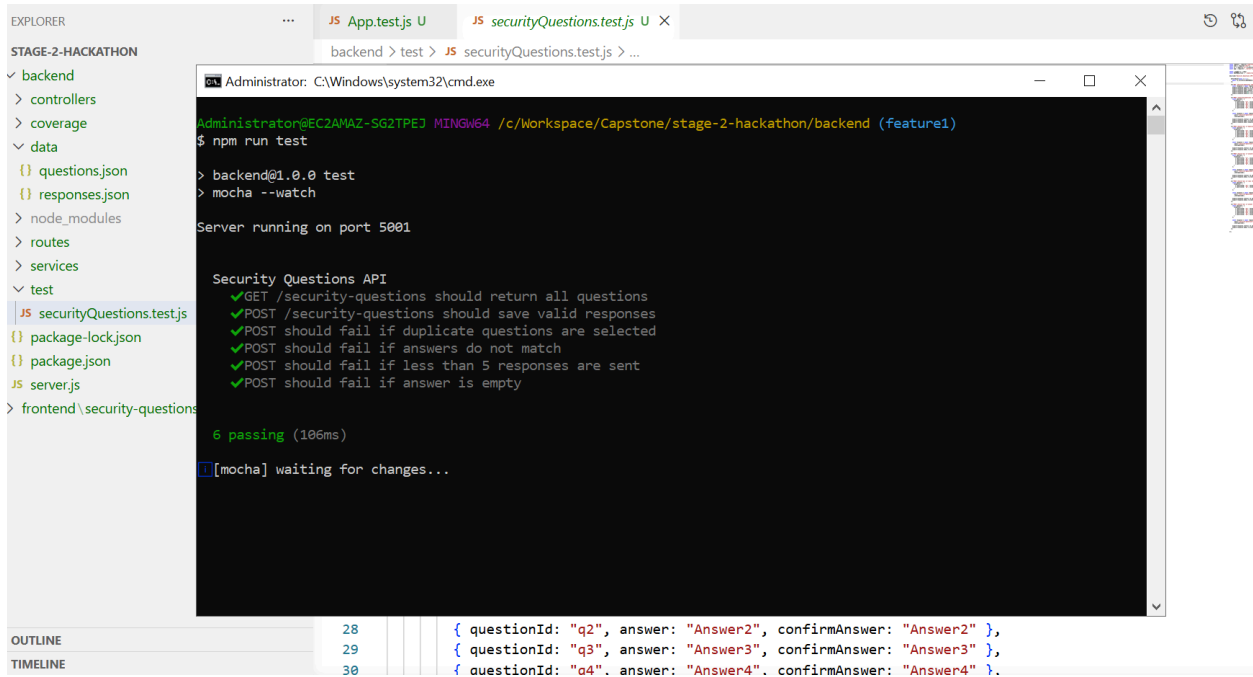

The "Hide Answers" checkbox is now unchecked. The "Update" button remains at the bottom.

Snapshot 2: Successful saving of responses on valid responses

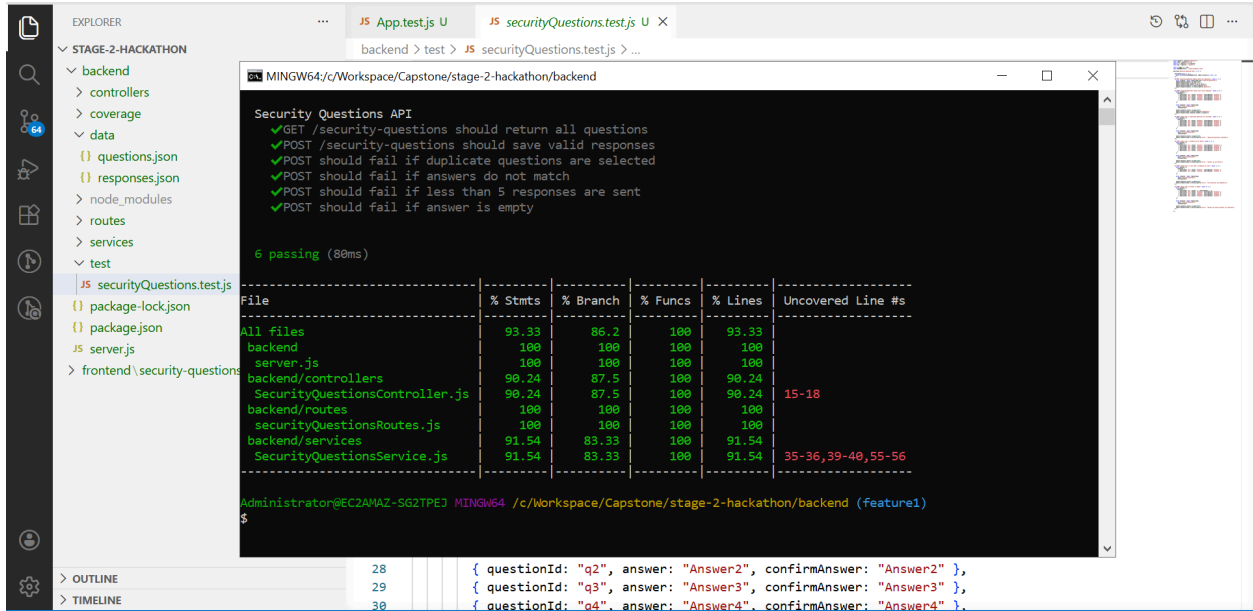

Snapshot 3: Failed to update as all fields weren't filled
